

# Moosa Junad

Addu City, Maldives • +960 7835181 • [junaadh.02@gmail.com](mailto:junaadh.02@gmail.com)  
[github.com/junaadh](https://github.com/junaadh) • [junaadh.dev](https://junaadh.dev)

## Summary

Software engineer with experience in systems and application development. Skilled in Rust, Swift, C/C++, and JavaScript frameworks, with experience building low-level infrastructure and user-facing applications across iOS, macOS, and web.

## Education

**Taylor's University** - Subang Jaya, Malaysia

*January 2023 - January 2026*

Bachelor of Computer Science (Honors)

Major in Cyber Security; Extension in Artificial Intelligence; CGPA: 3.42

**Addu High School** - Addu City, Maldives

*February 2019 - November 2021*

Pearson Edexcel A'level; GCE English & HSC; Science

**Sharafuddin School** - Addu City, Maldives

*January 2016 - November 2018*

Cambridge GCE O'level; IGCSE English & SSC; Science

## Work Experience

**Alva Productions** - Subang Jaya, Malaysia

Software Engineer Intern

*September 2025 - January 2026*

- Designed, developed, and refactored applications using SwiftUI
- Modelled application data flow using SwiftData with CloudKit integration
- Improved performance and responsiveness in Flutter applications
- Developed and maintained applications integrating Swift and Flutter components

**Dhiraagu** - Addu City, Maldives

Customer Support Specialist

*April 2022 - December 2022*

## Skills

- **Backend & Web Development:** Rust (Axum, Actix), TypeScript/JavaScript (Vite + React, Node.js, SvelteKit, Tailwindcss), Bun/Node — building high-performance, scalable, and secure APIs and web applications.
- **Mobile & Desktop Development:** Swift, SwiftUI, SwiftData, UIKit, React Native, Svelte — developing iOS and macOS applications with cloud integration, responsive UIs, and optimized performance.

- **Systems & Low-Level Programming:** Rust, C/C++, Zig — writing efficient, memory-safe system software, CLI tools, and performance-critical modules.
- **DevOps & Deployment:** Docker, Docker Compose, Docker Swarm, Colima, CI/CD pipelines, Caddy, Nginx, AWS, Cloudflare — containerizing applications, orchestrating services, automating deployments, and configuring secure infrastructure.
- **Monitoring & Observability:** Prometheus, Grafana, Loki — implementing system monitoring, visualizing metrics, and aggregating logs for production environments.
- **Server & Linux Administration:** Linux, VPS management, shell scripting — deploying and maintaining applications on Linux servers, configuring VPS environments, and managing server operations.

## Projects

**Aegis** - [github.com/junaadh/aegis](https://github.com/junaadh/aegis)

- Designed and built a headless authentication platform in Rust with a modular workspace architecture (10 crates) covering domain logic, HTTP handlers, persistence, caching, config, and migrations
- Implemented password authentication with Argon2id, WebAuthn passkeys, TOTP-based MFA with recovery codes, and session management with secure cookies and opaque bearer tokens
- Built guest identity flows convertible into registered users with role-based access control and immutable audit logging
- Engineered reliable async email delivery using the outbox pattern with SMTP transport and configurable templates for verification and password reset flows
- Designed PostgreSQL schema with UUIDv7 primary keys, encrypted TOTP secrets, token hashing, GIN-indexed metadata, and SQLx-based migrations
- Integrated Redis caching layer with connection pooling alongside PostgreSQL for session storage and runtime state
- Built a multi-package TypeScript SDK (@junaadh/aegis-core, @junaadh/aegis-server, @junaadh/aegis-react) published via Bun workspaces for client and server integration
- Containerized with a multi-stage Dockerfile and Docker Compose orchestration for local development with PostgreSQL, Redis, and Mailpit
- Configured GitHub Actions CI/CD pipeline with Rust formatting, clippy linting, full test suite, SDK typechecking, and integration tests against live service instances with health checks

**Bloom Light** — Production E-commerce Platform (DevOps + Full Stack)

[bloomlightmv.com](https://bloomlightmv.com) • Live production site • Code available upon request

- Deployed fully functioning e-commerce platform with live admin dashboard and customer storefront
- Architected secure infrastructure on Hetzner VPS with hardened firewall, Docker containers, and Docker Compose orchestration
- Built private Tailscale network connecting CI/CD runners to production services with encrypted peer-to-peer tunnels
- Implemented GitHub Actions CI/CD pipeline with self-hosted runners deploying through Tailscale for secure, zero-trust access
- Configured Caddy reverse proxy with automatic TLS via Cloudflare DNS challenge and HTTPS-only enforcement
- Integrated Cloudflare R2 for CDN-backed object storage and Neon for serverless PostgreSQL with connection pooling

- Designed multi-domain routing architecture (admin dashboard, root storefront, CDN assets) with origin isolation
- Implemented Next.js ISR and cache invalidation for dynamic content with real-time updates across distributed services
- Managed secrets securely via environment variables across build and runtime with Docker secrets for sensitive data

**Reqstly** - [github.com/junaadh/reqstly](https://github.com/junaadh/reqstly)  
[reqstly.com](https://reqstly.com)

- Built a self-hosted request management system using Rust and TypeScript
- Designed backend with Axum, PostgreSQL, and integrated CI/CD pipelines for automated deployment
- Implemented Dockerized infrastructure with Docker Compose for local development and scalable deployment
- Monitored system metrics using Prometheus and Grafana, with log aggregation via Loki
- Configured secure web serving using Caddy
- Supports tls using a valid certificate generated from CloudFlare
